

Git Exercise

Project Initialization:

Create a folder for your project and initialize a Git repository inside this folder.

Add a File:

Create a text file called `file.txt` and add the sentence:

"My first Git file."

Check the Repository Status:

After creating the file, check the repository status to see if it has been recognized by Git.

Add the File to Git Tracking:

Add the `file.txt` file to Git tracking.

Make a Commit:

Commit the changes with a message explaining the addition of the file.

Modify the File:

Open `file.txt` and add the sentence:

"Modifying the file for the first time."

Check the Status and Add the Modification:

Check the repository status after modifying the file, then add the modification to Git tracking.

Make a Second Commit:

Make a second commit to save this modification.

View Commit History:

Display the commit history to verify both commits.

Create a GitHub Repository:

Go to GitHub and create a new repository called `projet_git_simple`.

Link the Local Repository to GitHub:

Once the repository is created on GitHub, retrieve its URL and link your local repository to this remote repository.

Push Commits to GitHub:

Push your local commits to the GitHub repository you just created.
